Automated Planning

 LINKÖPINGS
UNIVERSITET

Co-funded by
the European Union

What is Automated Planning?

- \rightsquigarrow finding plans (sequences of actions)
- that lead from an initial state to a goal state
- Here: classical planning
- general approach to finding solutions for state-space search problems
- classical = static, deterministic, fully observable
- variants: probabilistic planning, planning under partial observability, online planning, ...

“Planning is the art and practice of thinking before acting.”

- P. Haslum

Classification

Automated Planning environment:

- **static** vs. dynamic
- **deterministic** vs. non-deterministic vs. stochastic
- **fully** vs. partially vs. not **observable**
- **discrete** vs. continuous
- **single-agent** vs. multi-agent

problem solving method:

- problem-specific vs. **general** vs. learning

Planning: Informally

given:

- state space description in terms of suitable problem description language (planning formalism)

required:

- a plan, i.e., a solution for the described state space (sequence of actions from initial state to goal)
- or a proof that no plan exists

distinguish between

- optimal planning: guarantee that returned plans are optimal, i.e., have minimal overall cost
- suboptimal planning (satisficing): suboptimal plans are allowed

What is New?

Many previously encountered problems are planning tasks:
blocks world

route planning in romania missionaries and cannibals 15-
puzzle

New: we are now interested in general algorithms, i.e., the
developer of the search algorithm does not know the tasks
that the algorithm needs to solve.

- no problem-specific heuristics!
- input language to model the planning task

State Space

- state spaces are (labeled, directed) graphs
- **terminology:** predecessor, successor, applicable action, path, length, costs, reachable, solution, optimal solution

State Spaces with Declarative Representations

How do we represent state spaces in the computer?

previously: as black box

now: as declarative description

represent state spaces declaratively:

- compact description of state space as input to algorithms
 - ↪ state spaces exponentially larger than the input
- algorithms directly operate on compact description
 - ↪ allows automatic reasoning about problem: reformulation, simplification, abstraction, etc.

Compact Description of State Spaces

How to describe state spaces compactly?

Compact Description of Several States

- introduce state variables
 - states: assignments to state variables
- ⇒ e.g., n binary state variables can describe 2^n states
- transitions and goal are compactly described with a logic-based formalism
- ⇒ different variants: different planning formalisms

Summary

planning:
search in
general state
spaces

input: compact,
declarative
